Valve cross section

Guided perforated plug which is integrated in the valve stem.

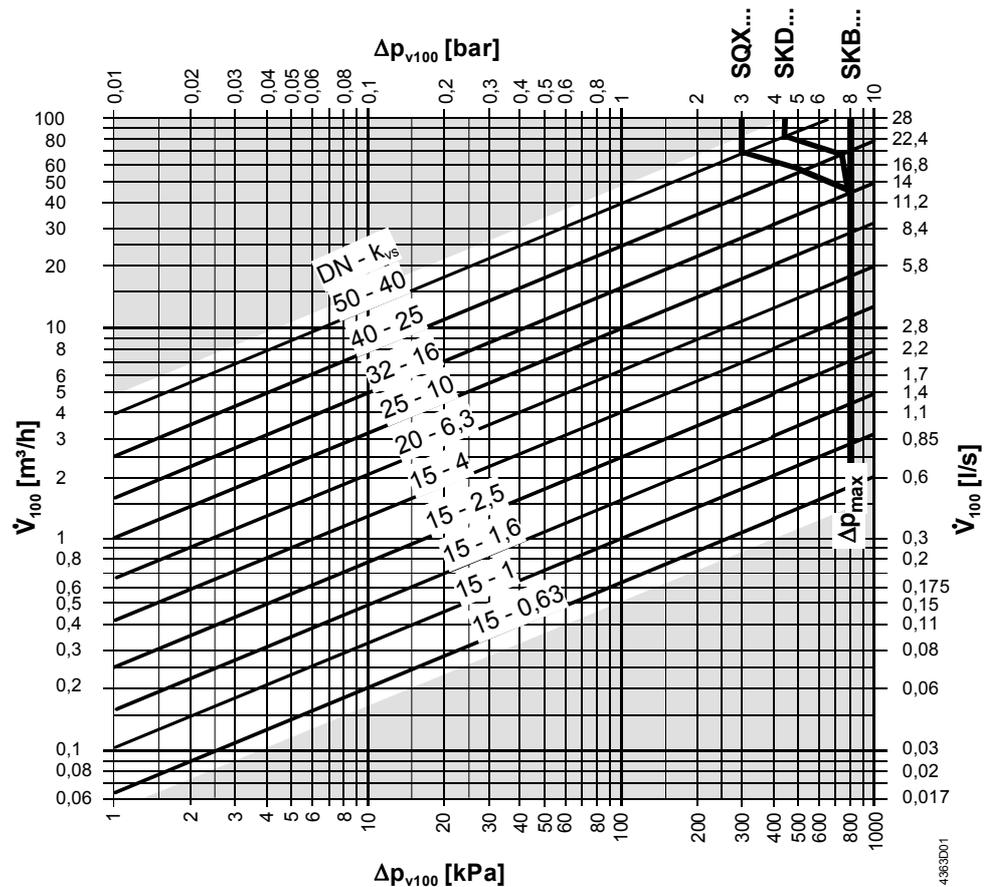

The seat is attached to the valve body with the aid of special gland material.

The 2-port seat valve does not become a 3-port valve by removing the seal cover!

Sizing

Flow diagramm

$\Delta p_{max}$  = Maximum permissible differential pressure across the valve's control path, valid for the entire actuating range of the motorised valve

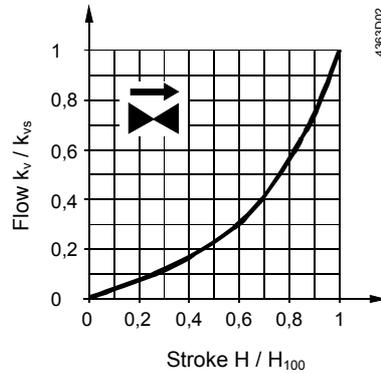

$\Delta p_{v100}$  = Differential pressure across the fully open valve and the valve's control path A → AB by a volume flow  $V_{100}$

$\dot{V}_{100}$  = Volumetric flow through the fully open valve ( $H_{100}$ )

100 kPa = 1 bar  $\approx$  10 mWS

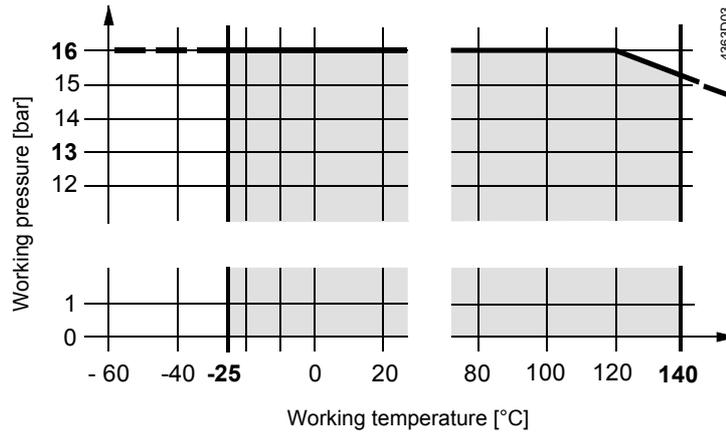

1  $m^3/h$  = 0.278 l/s water at 20 °C

**Valve flow characteristic**

0...30 % → linear  
 30...100 % → equal percentage  
 $n_{gl} = 3$  as per VDI / VDE 2173

**Working pressure and temperature**

Working pressure staged as per ISO 7268 and EN 1333  
 at operating temperatures of  $-25...+140$  °C as per DIN 4747 and DIN 3158

**Notes**

**Engineering**

We recommend installation in the return pipe, as the temperatures in this pipe are lower for applications in heating systems, which in turn, extends the stem sealing gland's life.

In open circuits, there is a risk of valve plug seizing caused by scale deposits. Thus, use only the most powerful actuator SKB... for these applications. Additionally, periodic actuation (twice or three times per week) must be planned. With closed and open circuits always use a strainer upstream of the valve to increase the valve's functional safety.

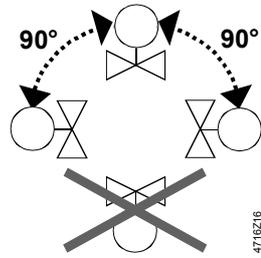

For media below 0 °C, use the electric ASZ6.5 stem heating element to prevent the valve stem from freezing in the sealing gland. For safety reasons, the stem heating element has been designed for AC 24 V / 30 W operating voltage.

**Mounting**

Both valve and actuator can easily be assembled at the mounting location. Neither special tools nor adjustments are required. The valve is supplied with Mounting Instructions 4 319 9563 0.

Orientation

Direction of flow

When mounting, pay attention to the valve's flow direction symbol →.

Commissioning

**Commission the valve only if the actuator has been mounted correctly.**

Valve stem retracts: valve opens = increasing flow

Valve stem extends: valve closes = decreasing flow

Maintenance

---

VVG41... valves require no maintenance.

When doing service work on the valve / actuator:

- Deactivate the pump and turn off the power supply
- Close the shutoff valves
- Fully reduce the pressure in the piping system and allow pipes to completely cool down

If necessary, disconnect the electrical wires.

Before putting the valve into operation again, make certain the actuator is correctly fitted.

Stem sealing gland

- The glands can be exchanged without removing the valve, provided the pipes are depressurized and cooled off and the stem surface is unharmed, refer to «Order».
- If the stem is damaged in the gland range, replace the entire stem-plug-unit.

Contact your local office or branch.

Disposal

Before disposal the valve must be dismantled and separated into its various constituent materials.

Legislation may demand special handling of certain components, or it may be sensible from a ecological point of view.

**Current local legislation must be observed.**

Warranty

---

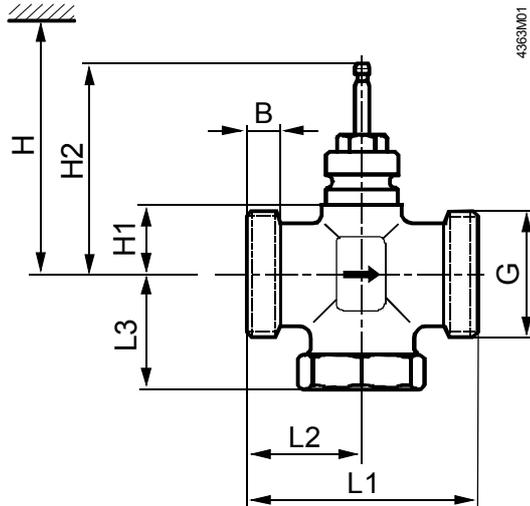

The technical data given for these applications is valid only in conjunction with the Siemens actuators as detailed under «Equipment combinations».

All terms of the warranty will be invalidated by the use of actuators from other manufacturers.
